

DriveIQ

Product Update & Walkthrough Guide

Events accuracy - Station hubs - Flights tiers - AI limits - Branded notifications -
Key road corridors

Prepared for: Zakariye / DriveIQ stakeholders

Date: August 2026

From: Development

This document summarises the latest product work shipped in development, and gives a step-by-step walkthrough so you can open the app and verify every change yourself before a store build.

1. Executive summary

I have pushed through the launch-critical and free/Pro work from your brief. The focus was: correct event times and date filters for launch; visible station hubs on the map with a free-tier gate; clearer flight save/notify limits; AI daily limits with a visible counter; and fully branded notifications including key London road corridors.

What changed (at a glance)

- Events - wrong end times and wrong-day filter pins fixed (Ticketmaster durations, multi-day rules, UK timezone).
- Connections - seven major termini as green map pins; free users get one station; Pro unlocks all.
- Flights - free: next 3 hours + 1 watched flight; Pro: full local day + up to 5 watched.
- AI Support - free: 5 questions/day with live counter; Pro: unlimited.
- Notifications - DriveIQ-branded copy across roads, lines, events, flights; ~25 min 'event ending' ping; key corridor closures always alert.
- Roads - M25, M4, M3, M1, M11, M40, A40, A406, A13, A1, A3, A4 and related busy routes covered in the highways feed + alert logic.

Agent + AI (your question)

The plan is one DriveIQ Agent with two channels: Chat (reactive) and Preemptive prompts (proactive notifications). Both share the same context - saved events, watched flights, free station, prefs, and live data - so they feel like one helper, not two products. Next step is letting chat also set up watches/reminders in conversation.

2. Detailed updates

2.1 Events - accuracy for launch

You flagged incorrect end times and wrong events on the map when filtering. I audited every provider path and fixed the root causes:

- Ticketmaster was using genre names (Rock, Musical, etc.) for duration lookup. Those keys were missing, so concerts/theatre silently fell back to a 2-hour end. Duration now uses the correct segment key (Music, Theatre, Film...).
- Date chips treated any end-time overlap as multi-day, so late shows bled onto Tomorrow and inflated ends could keep yesterday's events on Today. Only genuine multi-day fixtures (20+ hours) now span day chips.
- UK timezone handling fixed for SportsDB and ICS feeds (BST/GMT), so kick-offs are no longer an hour late in summer.
- Cold-launch cache tightened so yesterday's pins do not paint at launch.

Result: Today / Tomorrow / day filters and 'Ends ...' times should be trustworthy for launch.

2.2 Connections - stations on the map + free/Pro

Your proposal (see stations, free access to one, upgrade for the rest) is what I built:

- Paddington, Euston, King's Cross, St Pancras, Waterloo, Liverpool Street and Victoria appear as green train pins - visually separate from navy airport pins.
- Locked hubs show a gold padlock. First open claims the free station; others show the Pro path.
- Hub sheet shows live tube / Elizabeth / Overground / National Rail lines serving that terminus.
- Same gating in the Connections panel list.

2.3 Flights - save / notify tiers

- Flights remain tappable with a detail sheet and Watch for delays.
- Free: next ~3 hours of the board; 1 watched (save/notify) flight.
- Pro: full local day; up to 5 watched flights, with clear limit messaging.

2.4 AI Support - daily quota

- Free: 5 questions per calendar day; header shows 'X of 5 free questions left today'.
- Pro: unlimited.
- Hitting the free limit shows an in-chat upgrade prompt.

2.5 Notifications - branded + roads

- Copy rewritten in DrivelQ voice for roads, lines, saved events and watched flights (e.g. line down / flight delayed / event ending).
- Saved events now also schedule a ping ~25 minutes before the event ends - so drivers can leave ahead of the crowd.
- Key corridor closures (M25, M23, M20, M11, M40, M4, M3, M2, M1, A1, A2, A3, A4, A10, A12, A13, A20, A40, A406, A205...) always warrant an alert, even below 'Severe'.
- Incident / line / flight poll tightened to ~3 minutes while the app is open.

Note on real-time

Alerts are strong while the app is active. True background push when the app is closed needs a small server-side push layer - happy to scope that post-launch.

3. How to replicate / verify the updates

Use this walkthrough on a device or simulator running the latest development build. Allow notifications when asked. Skip the welcome tour so the map is clear.

Optional - Pro preview

To demo Pro behaviour: set EXPO_PUBLIC_PRO_PREVIEW=1 in the environment and reload, or leave it off to experience free limits first. You can also film free then Pro.

3.1 Events - times & filters

1. Open the map. Note All / Today / Tomorrow / day chips and counts.
2. Tap Today - only events that start today should show (a late show tonight should not also appear under Tomorrow).
3. Tap Tomorrow - yesterday's or tonight's late events should not bleed over.
4. Open a concert (O2 / Wembley / music). Check Ends is ~3 hours or ~22:45 for big arenas - not a wrong early finish.
5. Open a theatre / comedy pin - end time should look sensible (~2.5-3h).
6. If a multi-day fixture exists (e.g. cricket Test), it may appear across those day chips; single-night gigs must not.

3.2 Connections - map + free station

1. Pinch out over central London.
2. Find green train pins for the seven termini - separate from navy plane pins.
3. Locked hubs show a gold padlock.
4. Tap a locked station -> 'Choose your free station' (first time) or DrivelQ Pro upsell (after claiming one).
5. Claim one free station -> padlock clears; open the hub -> live lines + Get directions.
6. Tap another station -> stays locked / Pro prompt.
7. Open Connections (train icon) -> same station list with locks + All lines status.
8. With Pro preview on -> all stations open, no locks.

3.3 Flights - 3h / 1 watch vs full day / 5

1. Tap a plane pin (Heathrow / Gatwick / etc.).
2. Check rail links at the top, then the flights board.
3. Free: only the next ~3 hours; banner reflects 3h + 1 watched flight.
4. Toggle Full day of flights -> Pro paywall if not Pro.
5. Tap a flight -> Watch for delays.
6. Try watching a second flight -> free limit alert (1 only).
7. Pro: full-day toggle works; watch up to 5; 6th is blocked.

3.4 AI Support - quota counter

1. Menu -> DriveIQ AI Support.
2. Header shows 'X of 5 free questions left today' (or Pro - unlimited).
3. Ask a few questions (e.g. what is on tomorrow?, how do notifications work?).
4. Watch the counter drop.
5. After 5 (free) -> next ask gets the limit message + See DriveIQ Pro.
6. Pro: unlimited; no block.

3.5 Notifications + roads

1. Menu -> Notifications. Confirm channels: roads, lines, saved events, watched flights.
2. Save an event -> reminders schedule for 1 hour before start and ~25 minutes before end (fire only if the event is soon).
3. Watch a flight with the channel on -> delay/cancel pings on the ~3 min poll while the app is open.
4. On the map, look for traffic/incident markers on busy corridors (M25, M4, M3, M1, M11, M40, A40, A406, A13...). New key-road closures should notify with branded copy.
5. Line disruption escalating to severe/closed -> branded 'X is down - take a look'.

3.6 Suggested screen recording order for review

1. Wide map: green stations (locks) + plane pins + M25 / major roads visible.
2. Tap locked station -> free claim / Pro.
3. Open free station hub -> live lines.
4. Tap Heathrow -> flights board + watch + free limit.
5. AI Support header counter.
6. Notification settings + (if possible) one live road or line ping.

4. Reset tips (clean free demo)

If you need to re-demo free limits from scratch, clear app data / reinstall, or remove these local keys:

- driveiq.freeStation.v1 - claimed free station
- driveiq.pro.unlock - soft Pro flag (when not using EXPO_PUBLIC_PRO_PREVIEW)
- driveiq.aiQuota.v1 - AI question counter for today
- driveiq.savedFlights.v1 - watched flights
- driveiq.tour.seen.v1 / driveiq.notif.onboardingSeen.v1 - first-launch flow

5. What's next

- Wire chat and proactive alerts as one Agent (chat can set watches/reminders).
- RevenueCat / real paywall when store products and API keys are ready.
- Optional post-launch: server-side push for true background alerts.

Happy to jump on a call to walk through any of this before store release, or to send a short screen recording pack of the steps above.

- End of update -
