

What we are building

DriveIQ's AI will work as a personal assistant for every user - helping them stay one step ahead. It will work together with the features already in the app (Save, Notifications, Calendar, and live train / road / airport status), not as a separate chatbot.

In practice, that means the assistant will be able to:

- Remind users before events they care about (for example one or two hours ahead, or a timing they choose).
- Alert them immediately when a watched train or tube line is disrupted.
- Flag airport delay situations that affect their plans.
- Save events, change notification preferences, and set watches - either from buttons in the app or by talking to the AI.
- Learn each user's habits over time so suggestions stay relevant to them.

What is already in the app

- AI Support chat screen (ready to connect to a live AI model).
- Notification settings for roads, train/tube lines (including per-line toggles), and saved-event reminders.
- Save and Calendar actions on every event.
- Live map data for events, TfL status, and airport links.

What we need from you this weekend

To connect a real AI and turn on proactive alerts properly, we need the following on your side. Once we have these, we can wire everything into the app and ship the next TestFlight build.

1. AI provider account

Please create an account with one of these providers and enable billing / credits so the assistant can run in production:

- OpenAI (ChatGPT / GPT models), or
- Anthropic (Claude), or
- Google AI (Gemini)

If you do not have a strong preference, we recommend OpenAI or Anthropic for this use case.

2. API key and model choice

Please send us (securely, not in a public chat):

- Which provider you chose
- The API key
- Preferred model name - or tell us to choose the best default
- Any monthly spend limit you want us to respect

3. Firebase (already partly set up)

DriveIQ already uses Firebase for accounts. To keep the AI key safe (not stored inside the app) and to store each user's preferences and memory, we need Firebase Blaze (pay-as-you-go) enabled on the DriveIQ Firebase project if it is not already.

4. Privacy policy note

Please add a short line to the privacy policy stating that assistant chats and related preferences may be processed by our AI provider. Apple requires this before release.

What happens next

- You set up the AI account and send the details above.
- We connect the live model to DriveIQ AI Support.
- We code the assistant actions: save, notify, watch lines, timed reminders, disruption pings.
- We store per-user preferences so the assistant learns with each person.
- We verify notifications on a real device / TestFlight and send you the update.

Timing

We know schedule is tight. As soon as the account and API key are ready, we can start the integration immediately and prioritise the assistant + notification work for the next build.

If you have any preference on provider (OpenAI / Anthropic / Google), tell us when you set the account up and we will configure the app to that choice.
